

Doing business and doing something about the environment can start here

Environmentally friendly retail signs.

Just like the electric light bulb revolutionized the way we used light a century ago, today LED technology is a more energy efficient, vividly bright, long lasting light source that is virtually maintenance-free for up to 100,000 hrs in optimal conditions.

In an extremely competitive retail environment, Slim-Brite, an energy efficient poster display sign, can help add to your competitive advantage by attracting more customers and reduce operating costs.

Retailers know the importance of bright vivid display signs to help attract customers and sell merchandise, but lighting is an energy hog to both your bottom line and the environment. In fact, the International Energy Agency estimates that lighting accounts for 19% of the world's electricity consumption and, although new ballast technology is making fluorescent tubes more efficient, they remain 20th century technology. The best way to curb this unsustainable demand on our resources is to replace outdated lighting technology with 21st century LEDs (Light Emitting Diodes)

Just like the electric light bulb revolutionized the way we use light a century ago, today LED is a more energy efficient, vividly bright, long lasting light source that is free of lead, mercury, IR and UV radiations. We have tapped into this LED technology to design the new Slim-brite line of high quality, energy efficient poster display sign system.

Slim-brite display signs incorporate the latest advancements in LED technology, cutting electricity consumption by more than 70%. The line is designed to allow designers to use the product in many different configurations and sizes from as small as 8" x 8" up to 46" x 120".

Slim Brite

Environmentally friendly retail signs.

Slim-Brite signs can be illuminated using 1 or 2 edges for maximum energy efficient illumination, or 4 edges for maximum illumination.
